

IMS Connect: Much More than a TCP/IP Gateway !

Session A06

Suzie Wendler – wendler@us.ibm.com

Sharpen your competitive edge
2016 IMS Technical Symposium
March 7 – 10, 2016
Wiesbaden, Germany

www.ims-symposium.com

Topics

- **IMS Connect Architecture – continuously evolving**
 - Included in IMS Version 9 as part of System Services
 - TCP/IP server foundation for
 - Transaction access and commands
 - Type-2 commands for IMS resources
 - *Enhanced Type-2 commands for IMS Connect resources (IMS 12)*
 - DB access (IMS 11)
 - IMS Connect API (IMS Enterprise Suite)
- **Along with Support for IMS-IMS Interaction**
 - Asynchronous Program Switching (IMS 12)
 - MSC (IMS 12)
 - ISC (IMS 13)
- **And Support for Calling out to distributed environments**
 - Along with ICAL enhancements for control data (IMS 14)
- **In a high availability environment**
 - VIPA, DVIPA, and Sysplex distribution
 - Super member support
 - TPIPE Parallelism (IMS 14)

A Continuously Evolving Architecture

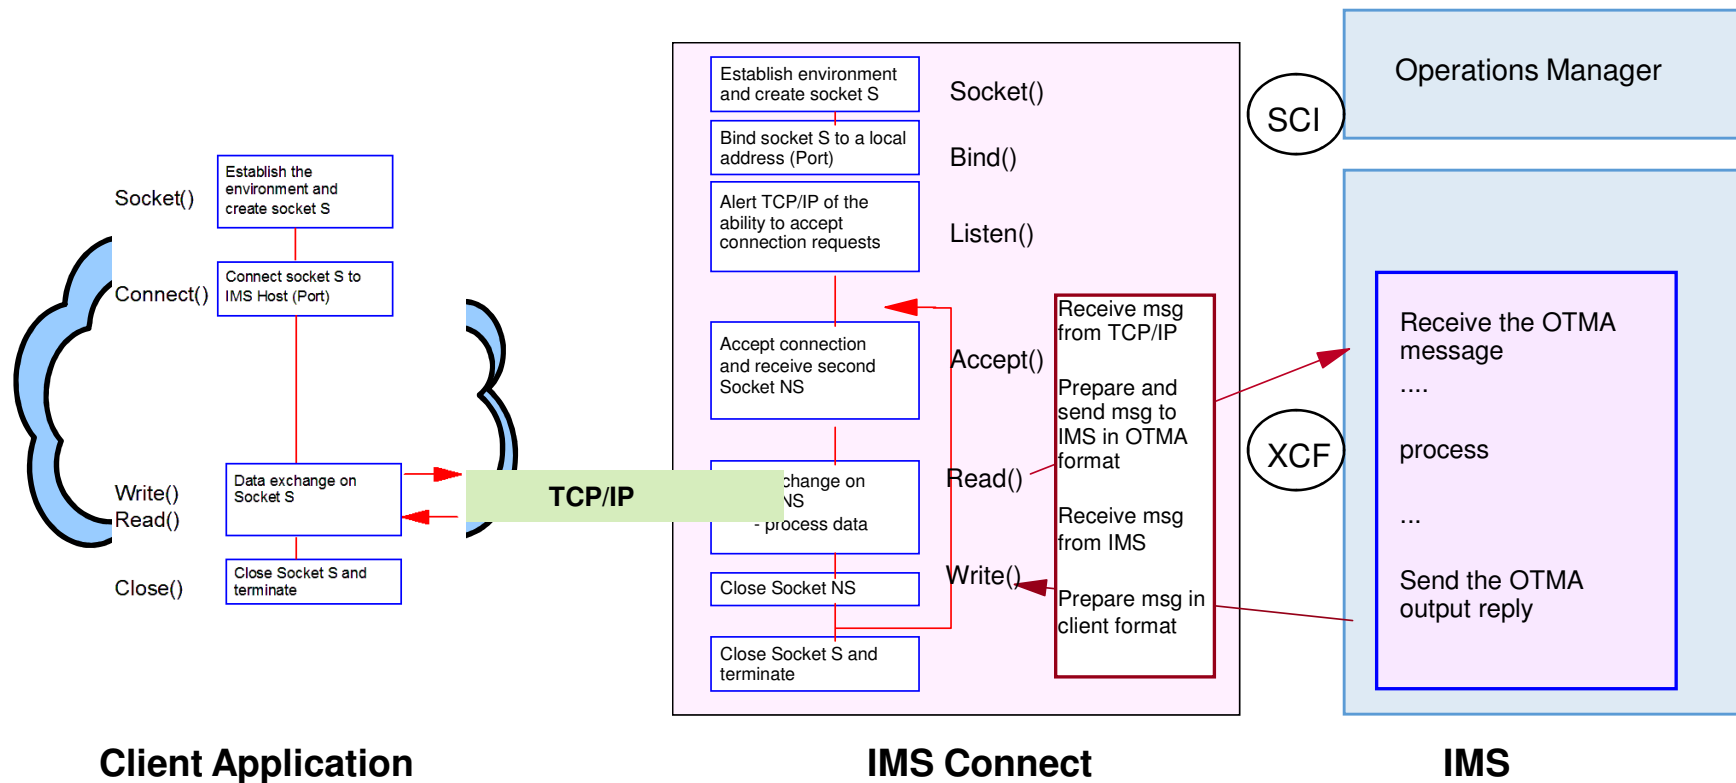

IMS Connect Architecture – Continuously Evolving

- **Provides the IMS capability to integrate with TCP/IP environments**
 - Delivered as part of IMS – part of System services
 - Supports TM/DB, DCCTL, and DBCTL environments
 - Configured on a z/OS server

- **Benefits and Value**
 - Supports TCP/IP sockets access to:
 - IMS transactions and commands
 - IMS databases
 - Supports
 - Provides a general purpose and structured interface
 - Provides a strategic base for new connection technologies
 - Supports migration for existing environments to TCP/IP
 - ...

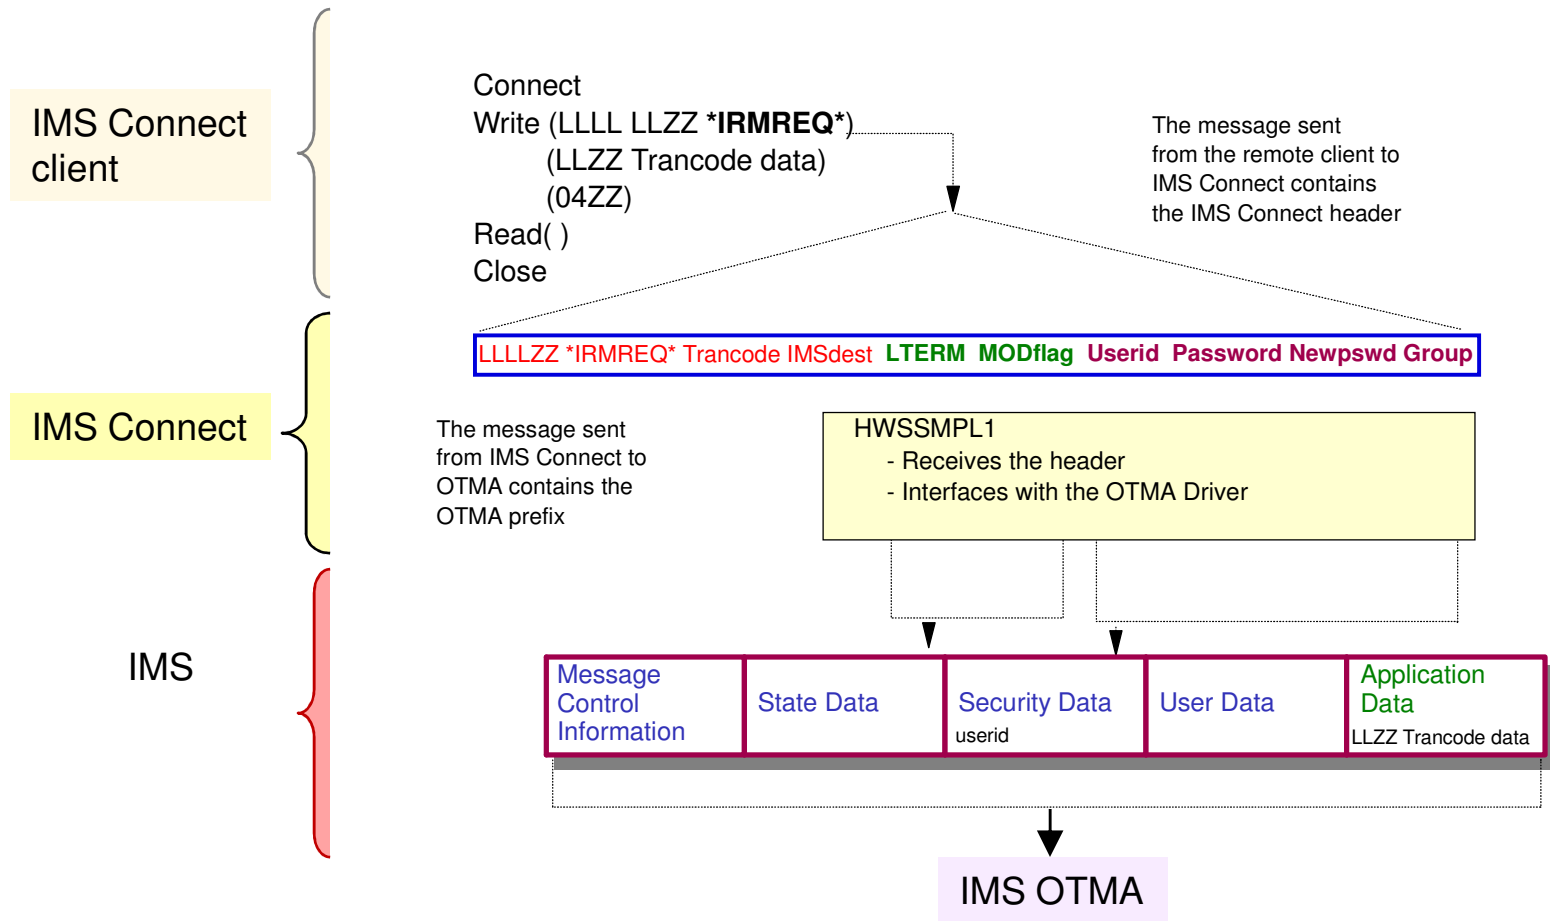

In the Beginning

- IMS Connect provided a way for TCP/IP access to transactions and commands

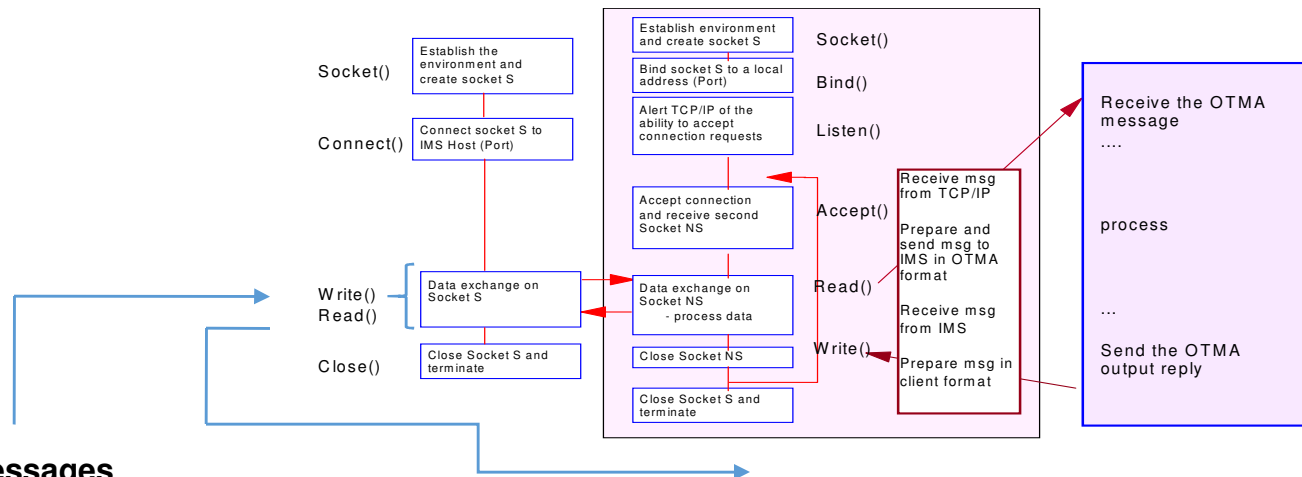

IMS Connect – OTMA Message Protocol

- With access to IMS using the OTMA interface

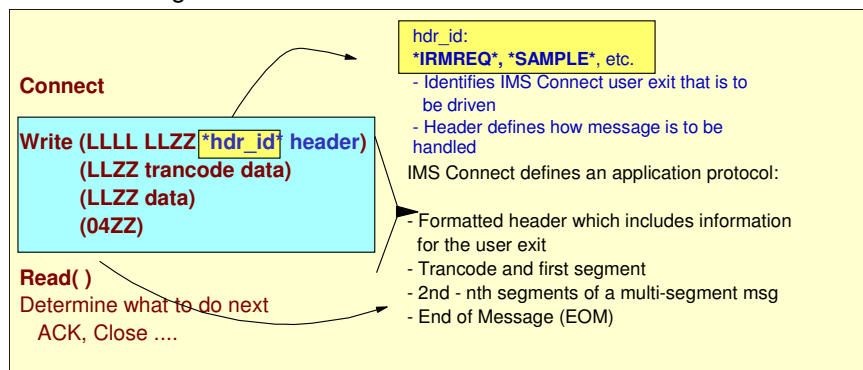

And a Defined Application Protocol

IMS Connect application program interface

Input Messages

LLLL = length of entire msg including all data segments and the EOM
 LL = length of the header data

Note: hdr_id + header are often generically referred to as the IRM (IMS request message)

Output messages

- CSMOKY (Complete Status Message)
 - Sent by IMS Connect upon successful interaction with IMS
- RMM (Request Mod Message)
 - Returned as the first structure of an output message if the MFS mod name was requested
- RSM (Request Status Message)
 - Sent by IMS Connect upon rejection of an inbound request
 - Return and reason codes are documented in the IMS Connect manuals
- Outbound application reply message
- COR (Synchronous Callout Correlator Token)
 - Provides the necessary token for IMS to tie the request and reply together

LLLL LL ZZ *CSMOKY*

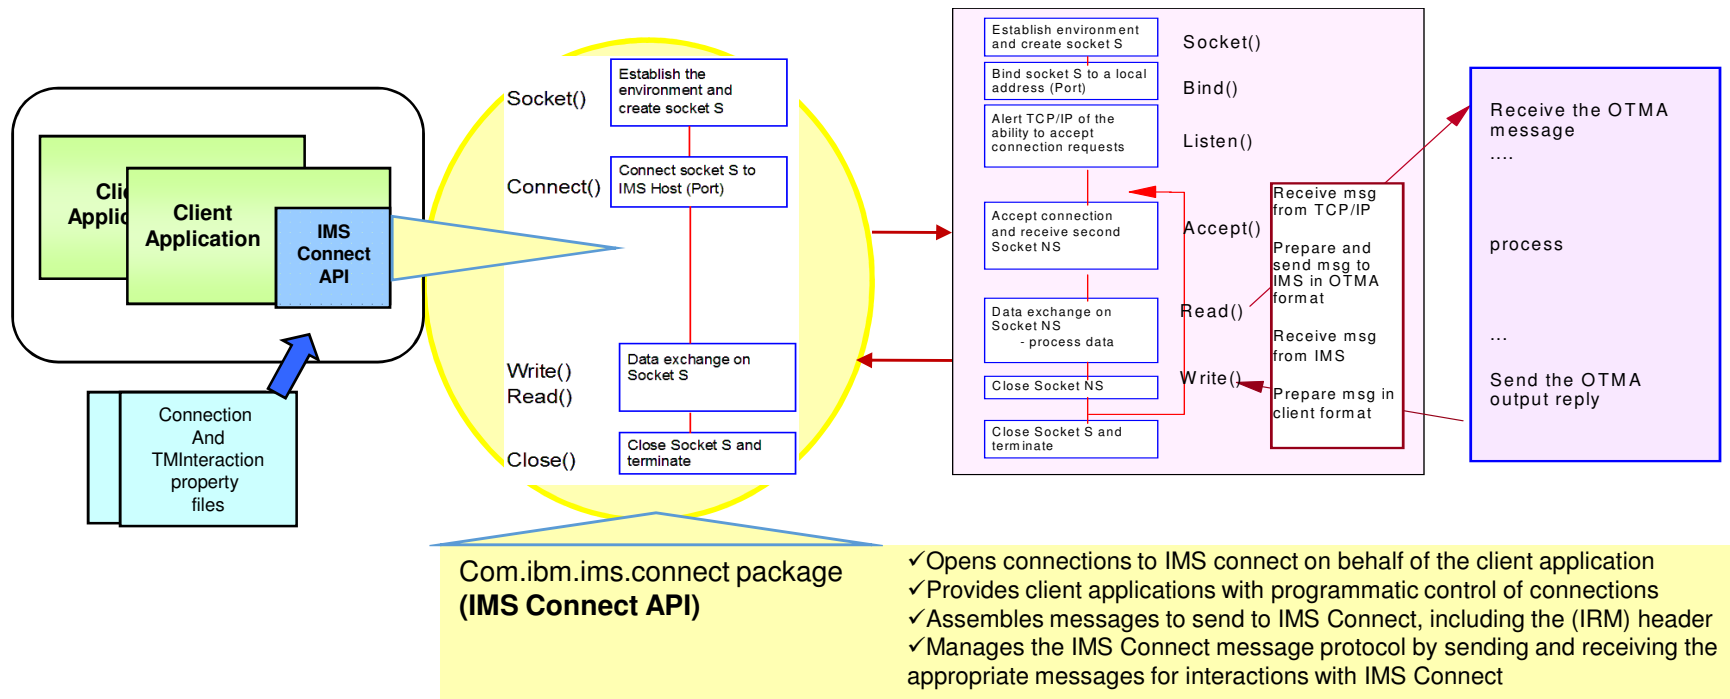

LLLL LL ZZ *REQMOD* MFS mod name

LLLL LL ZZ *REQSTS* Return code Reason code

LLLL LL ZZ data ...

LLLL LL ZZ *CORTKN*

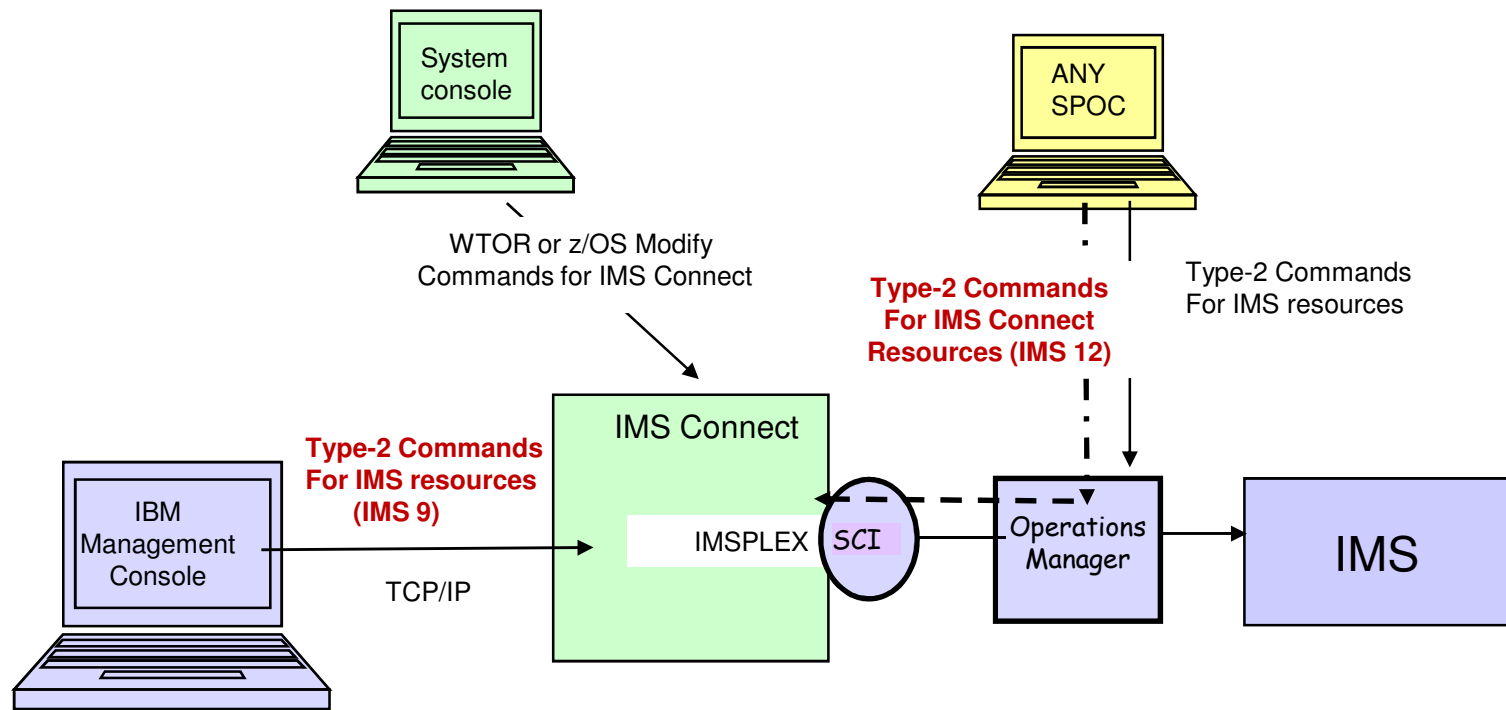

Simplification of the API interface

- **IMS Enterprise Suite IMS Connect API for Java (initially introduced for support with IMS 10/11)**
 - Streamlined interface for interacting with IMS Connect (com.ibm.ims.connect package)
 - Simplifies Java client applications with easy methods for managing socket connections and the IMS Connect interaction protocols
 - Addresses the complexities of RYO programs
 - Hides the intricacies of both sockets programming and the application protocol
 - **Supports**
 - Single and multi-segment message
 - Commands (both type-1 and type-2)
 - Synchronous callout

With Enhanced Command Support

- Support for Type-2 commands for IMS resources and for IMS Connect resources

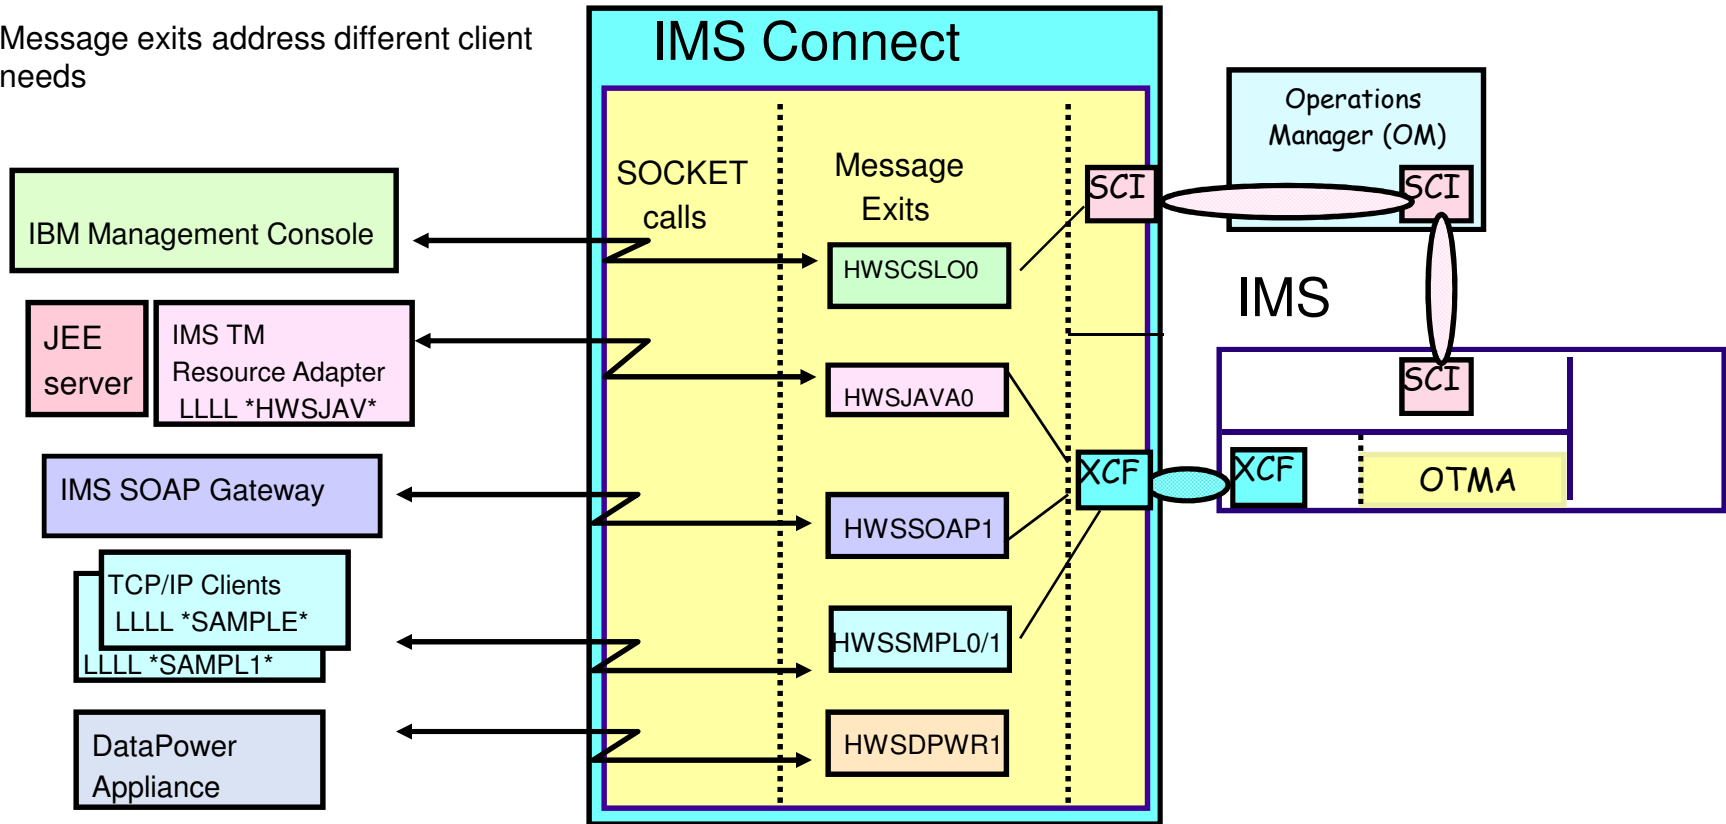

And Modification using Exit Routines

▪ Mechanism to modify IMS Connect behavior

- HWSUINIT – Initialization/Termination
 - Has access to a user-defined table
- **Message Exits** – affect each message 
 - Depending on the environment: HWSSMPL0/1, HWSSOAP1, HWSJAVA0, HWSDPWR1
- HWSCSLO0/O1 – For support of clients entering type-2 commands
 - Used by IBM Management Console for IMS and DB2
- HWSTECL0 – for event recording (performance and data analysis)
 - Used by IMS Connect Extensions
- HWSPCH0 – Password change
- IMSLSECX – Security
- ODBM support
 - HWSAUTH0 – DB security exit
 - HWSROUT0 – DB routing exit
- HWSEXPIO - Port Message Edit Exit
 - Allows modification of Input messages before IMS Connect processing and output messages before being sent to the TCP/IP client
 - *Addresses the need when a remote program cannot conform to the IMS Connect standard header requirements but needs the functionality of IMS Connect*

Exit Routines ...

Message exits address different client needs

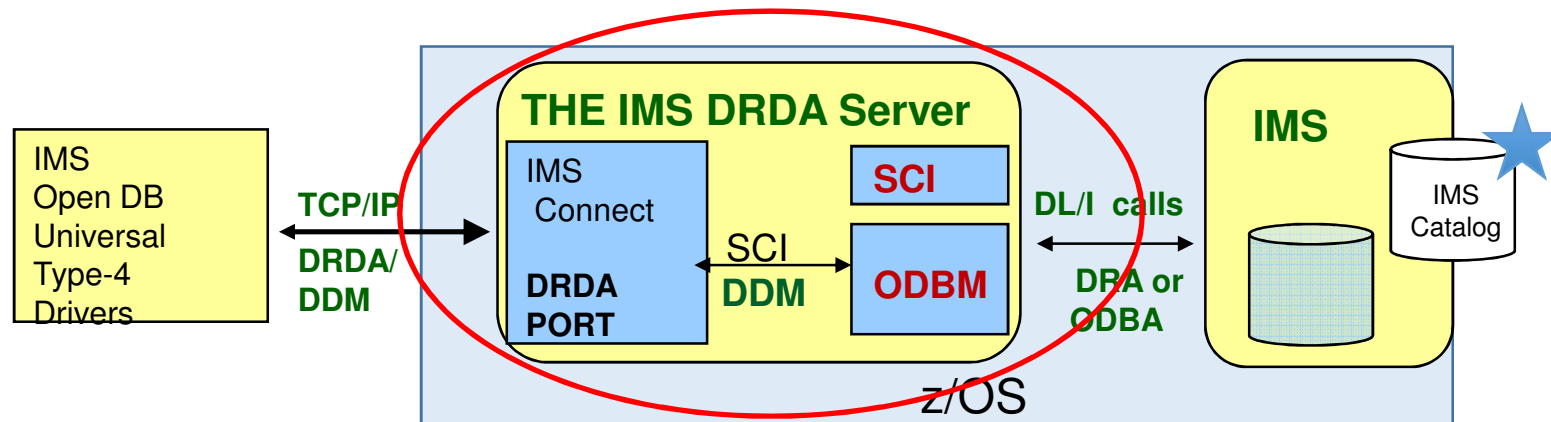

Each exit places its identifier (ascii/ebcdic versions) in an IMS Connect table
 E.g.:
 HWSJAV
 IRMREQ *IRMRE1* ...
 SAMPL0 *SAMPLE1" ...
 ...

As well as Database Support

■ DRDA (Distributed Relational Database Architecture) implementation via TCP/IP, IMS Connect and ODBM

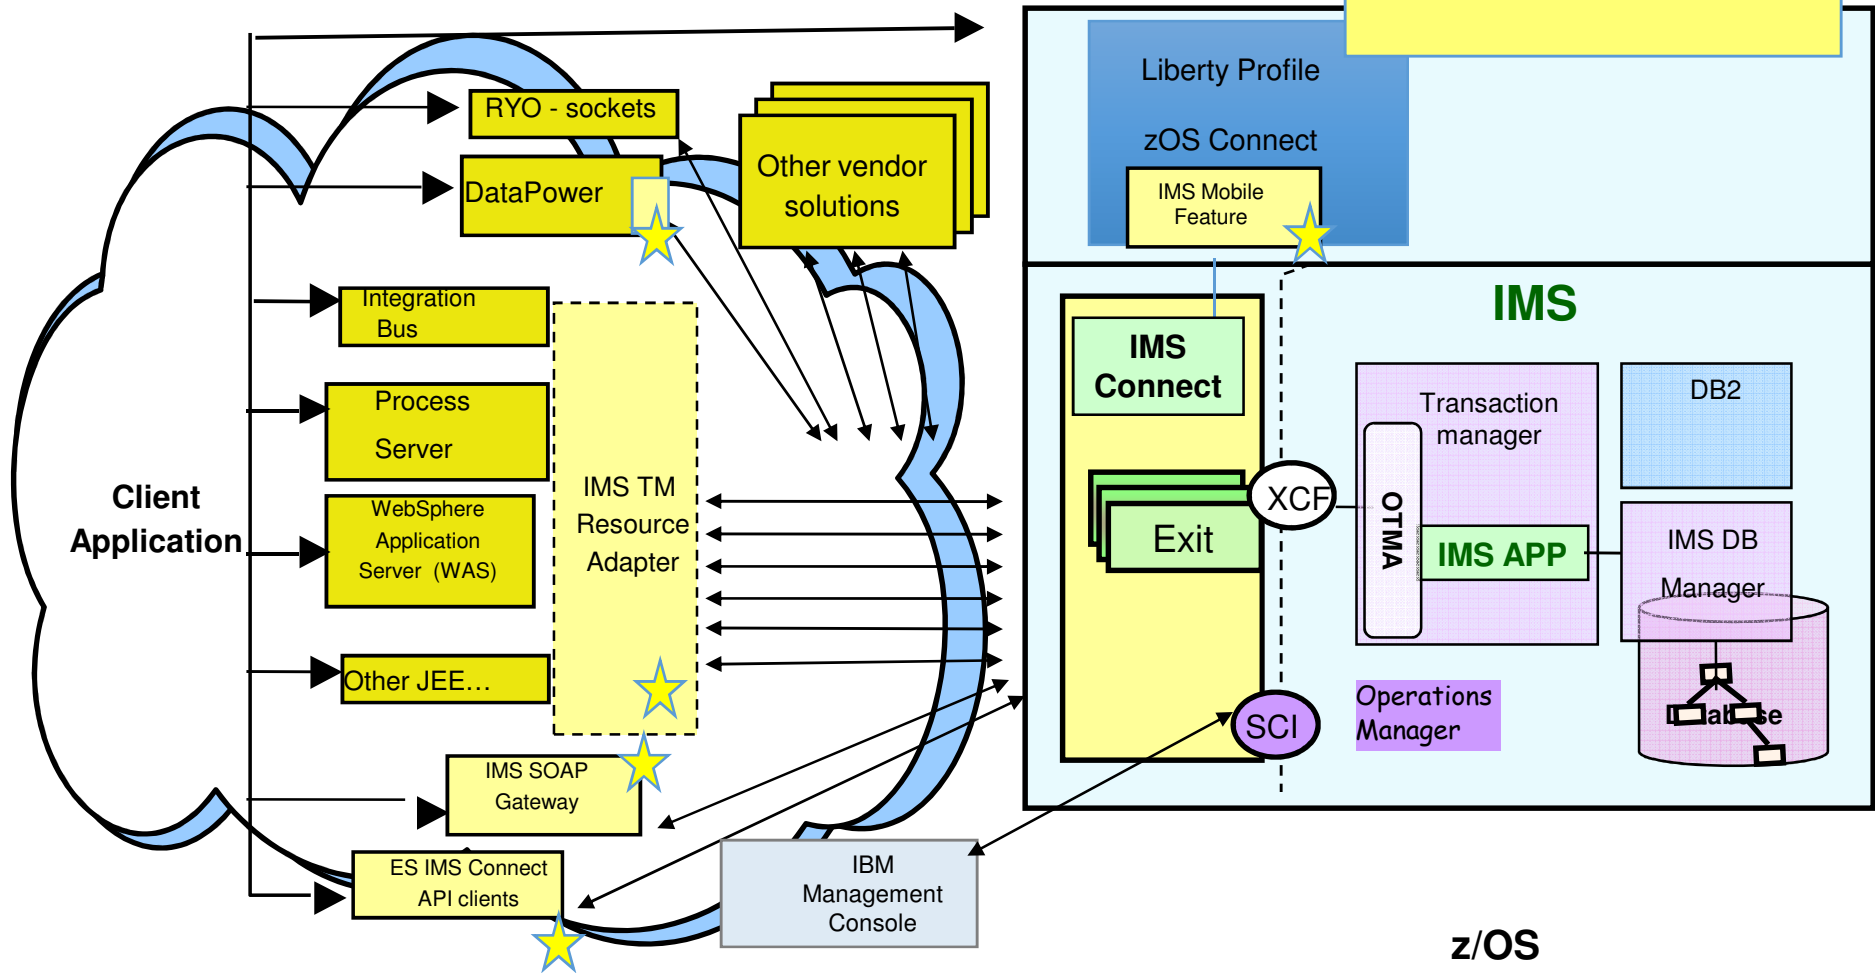

- Open Data Base Manager (ODBM) – a CSL address space (Common Service Layer)
 - Works with IMS Connect to provide distributed access to IMS databases
- IMS Connect
 - Accesses ODBM via SCI (Structured Call Interface which is implemented by another CSL address space also called the SCI)
 - Can be used in a DBCTL environment

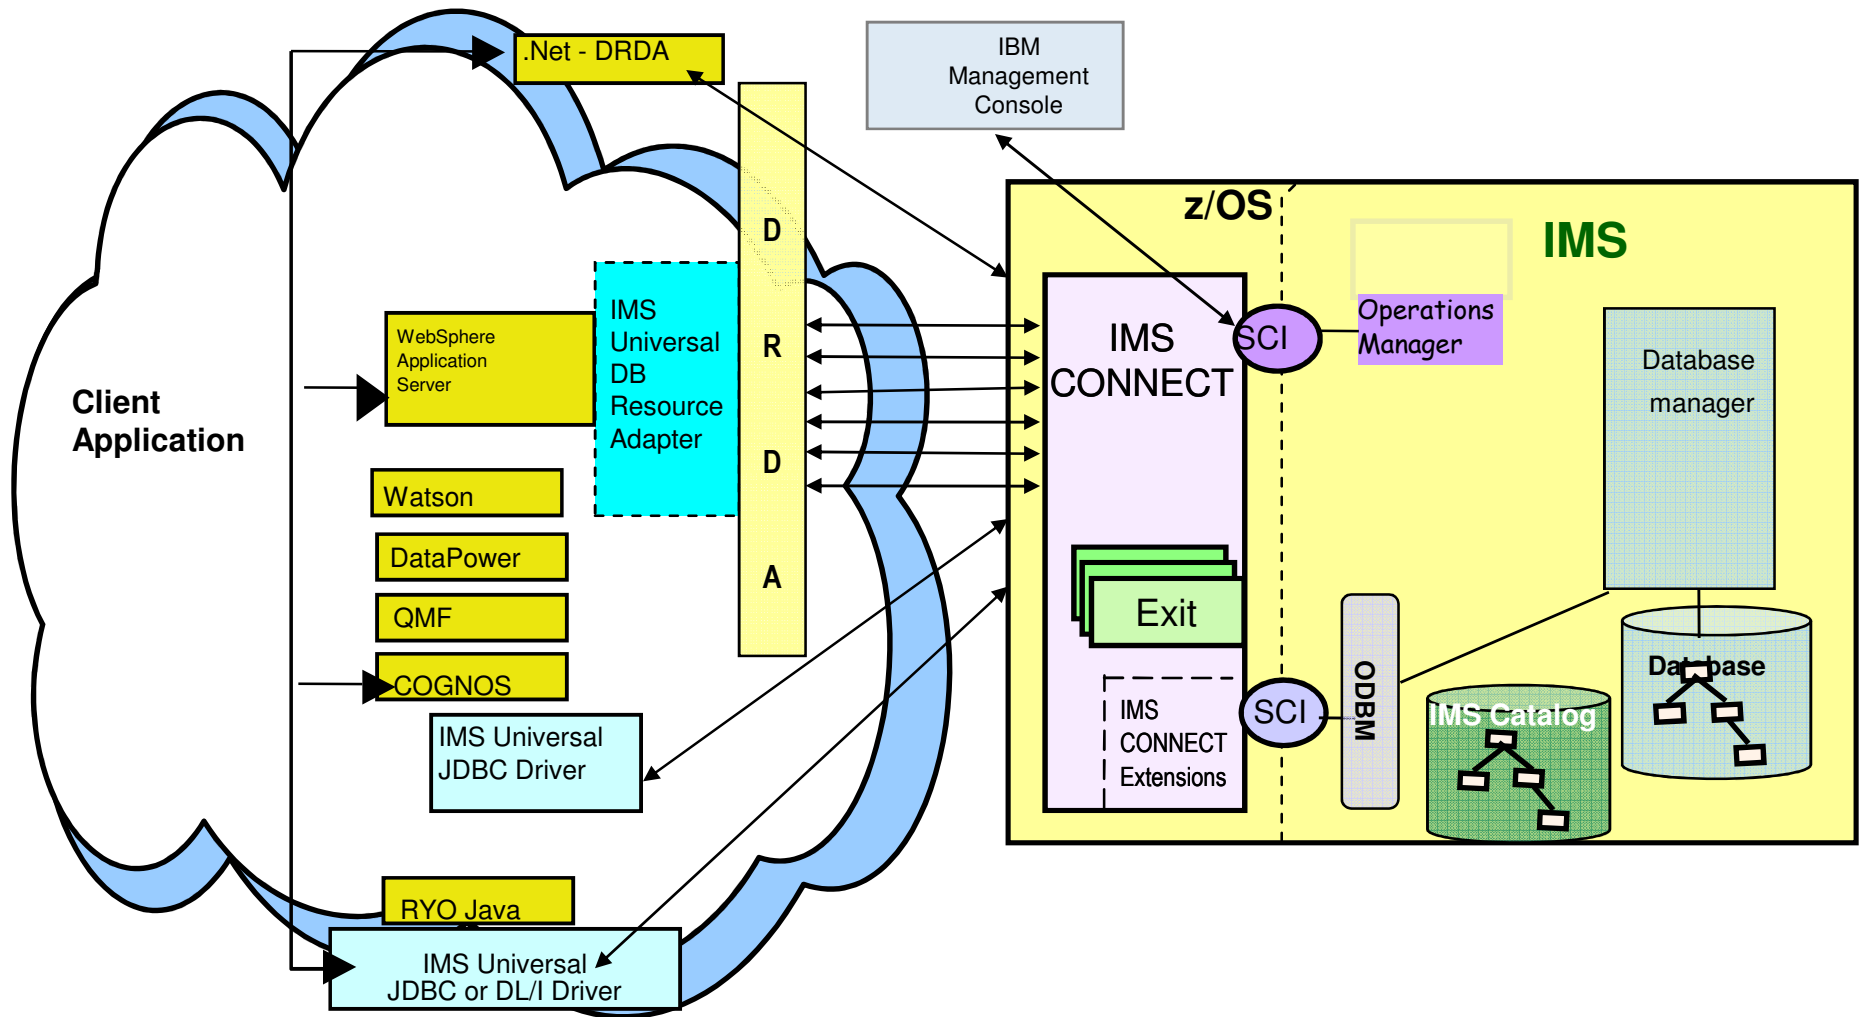

IMS Connect – Provides Integration to Transactions and Commands

★ IMS provides client-side components

More detail on the integration capabilities in session:
The Ever-evolving Impacts of Cloud and Mobility on Enterprise Growth

IMS Connect –Integration to Databases

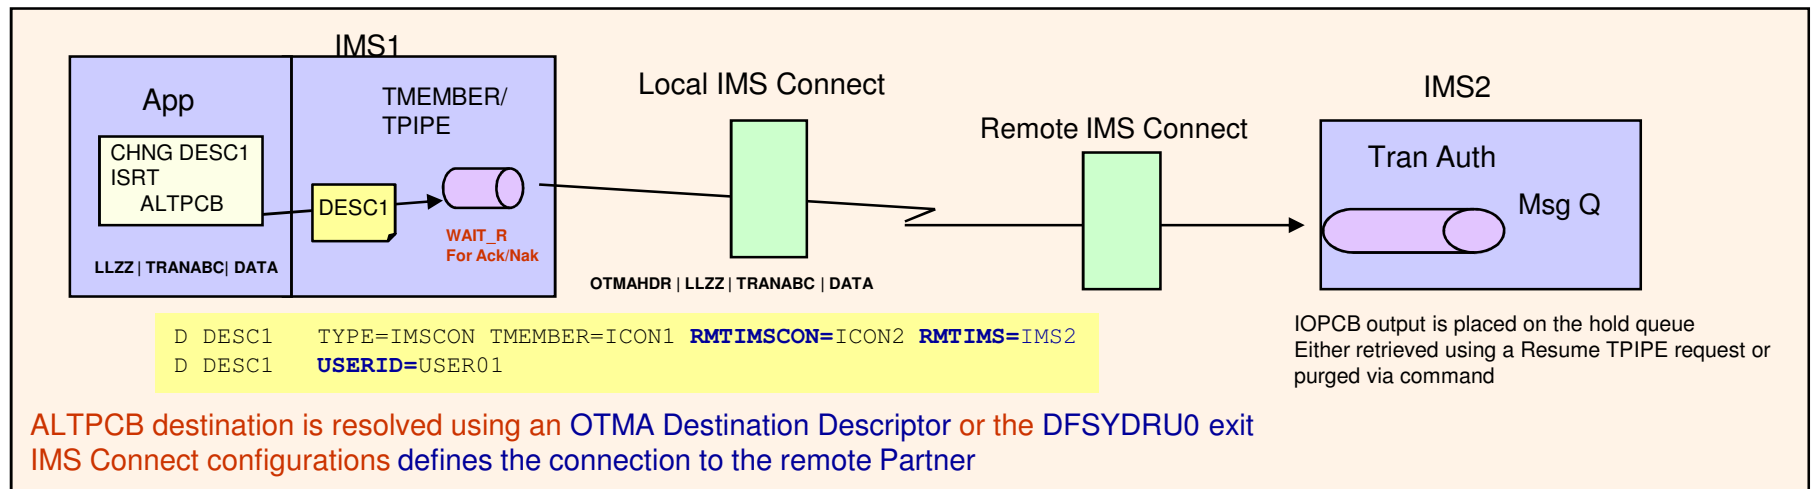

***Along with Support for IMS-
IMS Interaction***
(enhancing traditional protocols)

IMS Connect – Also enhances traditional protocols

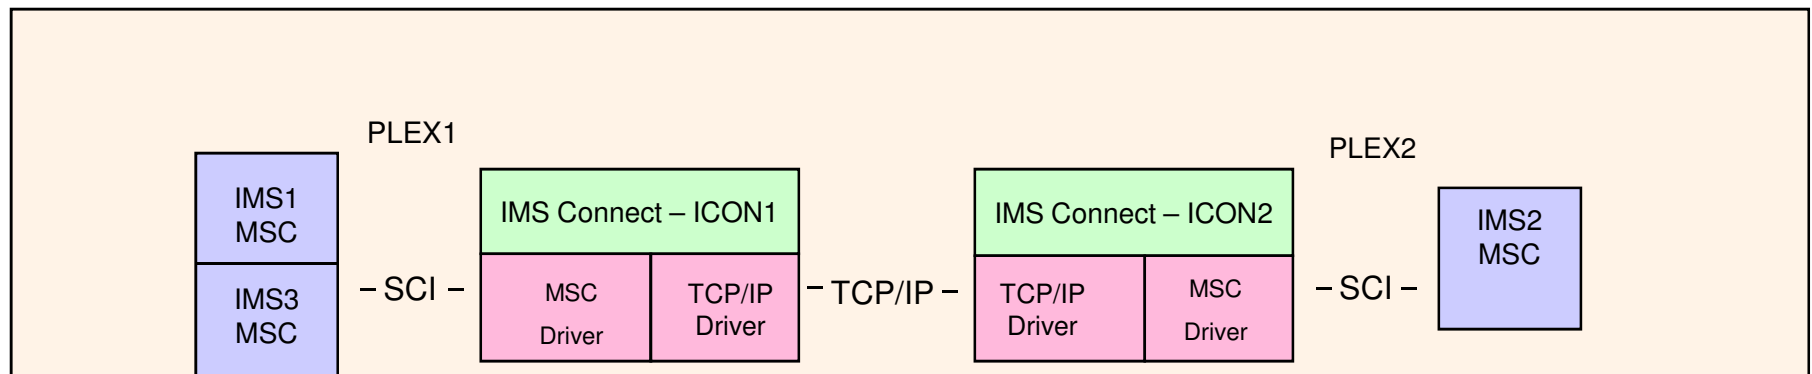

▪ **Asynchronous IMS - IMS TCP/IP Support (IMS 12)**

- TCP/IP connections between the local and remote IMS systems
 - Managed by IMS Connect to IMS Connect communications
 - *Without having to write client code or invoke additional gateways*
- OTMA
 - Sends OTMA remote ALTPCB messages to IMS Connect using new destination information (OTMA destination descriptors or DFSYDRU0 exit Routine)
- IMS Connect
 - Receives OTMA ALTPCB messages from a local IMS and sends them to the remote IMS Connect for processing in the remote IMS
 - *Enhanced IMS Connect configuration specifications*

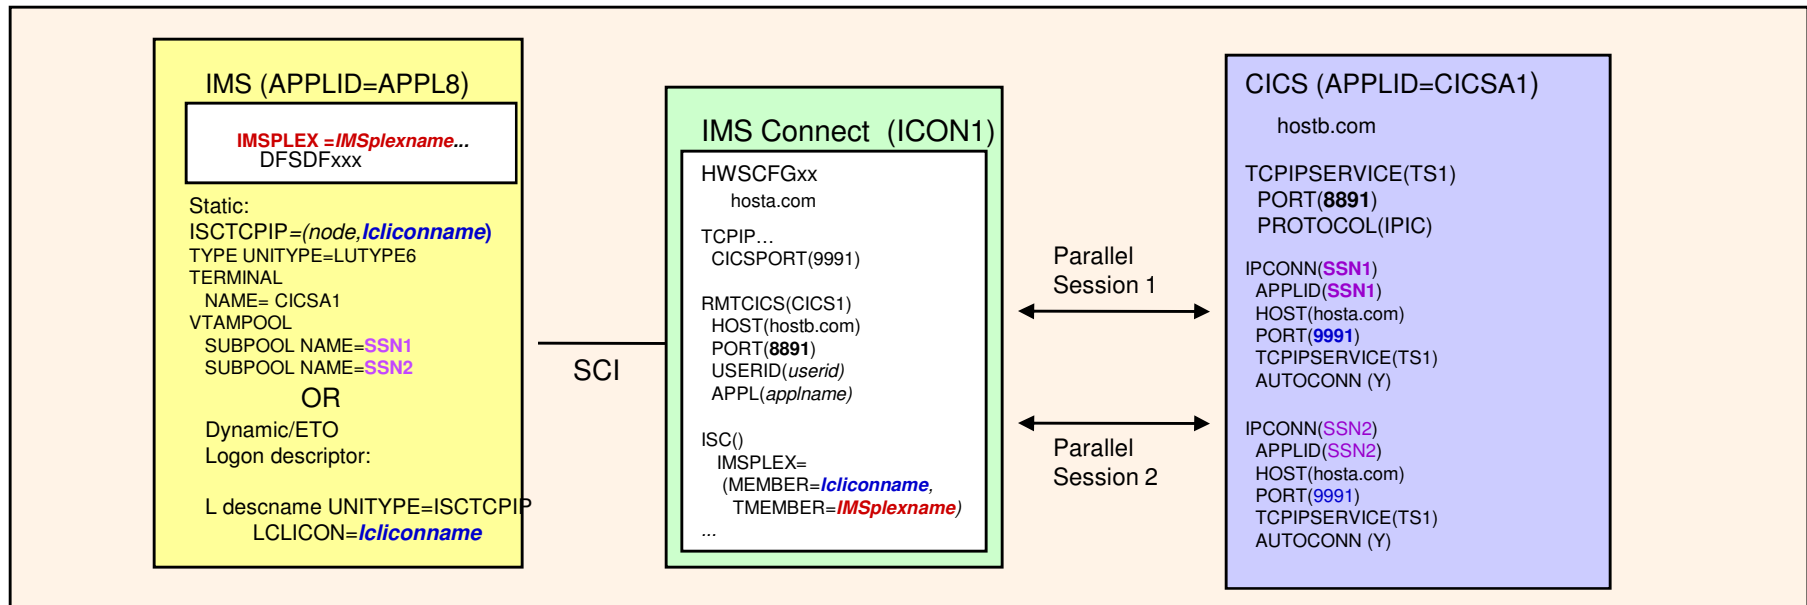

IMS Connect – Also enhances traditional protocols ...

- **Support for MSC communications (IMS – IMS) across a TCP/IP link (IMS12)**
 - Physical link MSPLINK TYPE=TCPIP
 - Provides a mechanism to complement or backup existing SNA/VTAM links
 - Take advantage of potentially higher bandwidths
 - Supports operational compatibility with other link types (CTC, MTM, VTAM)
 - Leverages IMS Connect and the Common Service Layer
 - IMS Connect sends/receives messages via the TCP/IP network
 - IMS MSC manages the message processing
 - CSL provides the Structured Call Interface (SCI) for communications between IMS components including IMS Connect

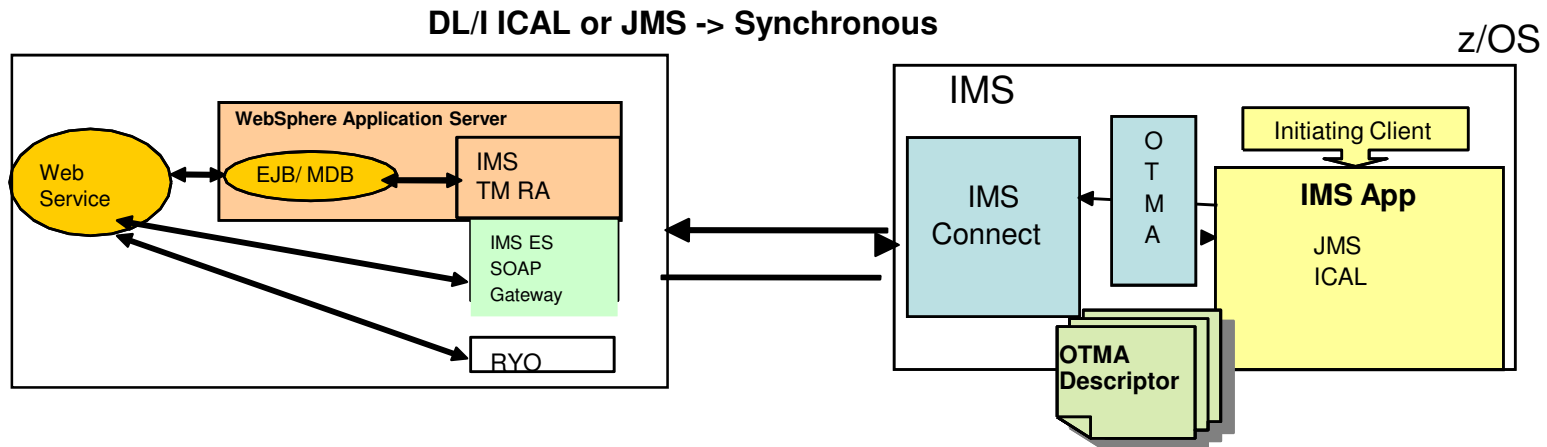

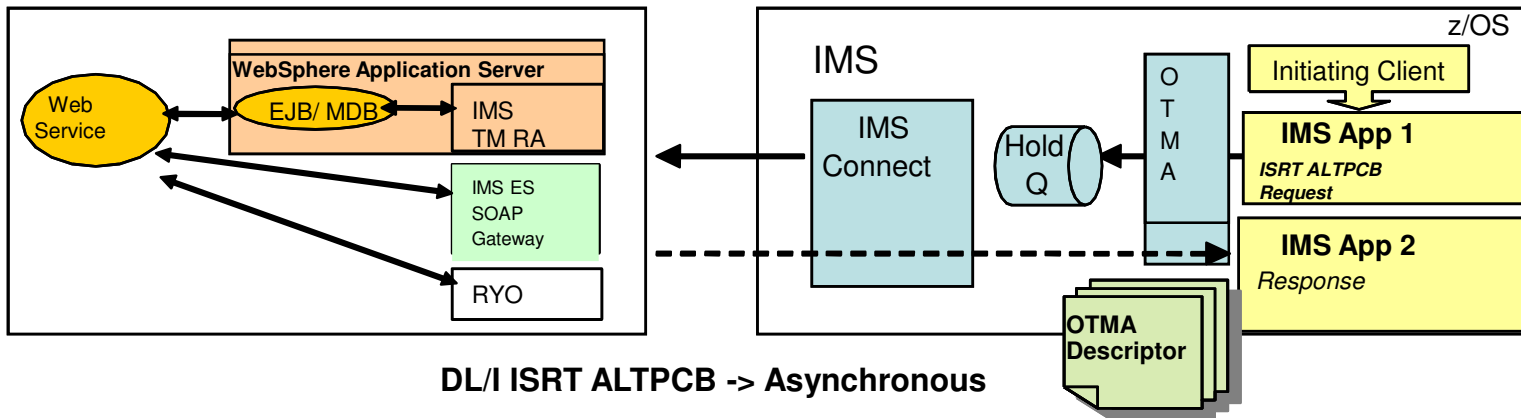

IMS Connect – Also enhances traditional protocols ...

- **Support for ISC communications (IMS – CICS) across a TCP/IP link (IMS13)**
 - Leverages existing static/dynamic terminal definitions
 - New keyword: ISCTCPIP in DFSDCxxx
 - Specifies that an ISC-defined terminal is to use the TCP/IP support
 - The Common Service Layer (CSL) provides the Structured Call Interface (SCI) for communications between IMS and IMS Connect
 - Minimum CICS 5.1 - leverages existing IPIC connectivity capability

***With Support for Calling out to
distributed environments***

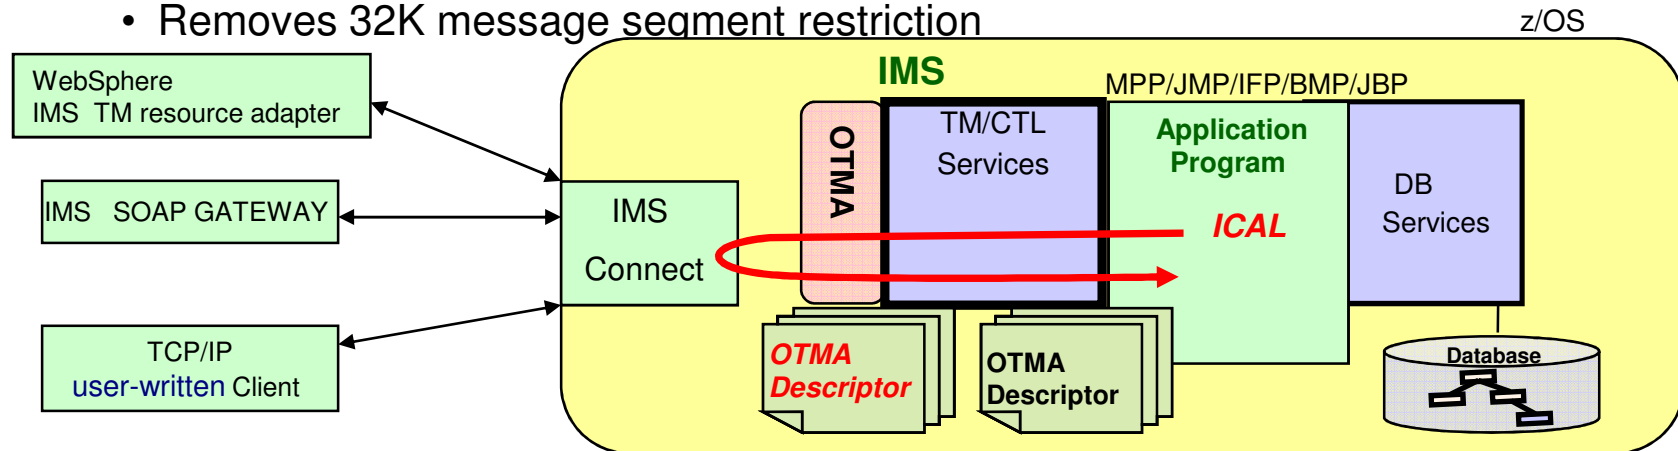

IMS Application Callout

IMS Synchronous Callout

DL/I ICAL

- Allows IMS transactions to access a service outside IMS and wait for a reply within the same unit of work
 - Positions IMS as both a client and a server - integrates IMS with other server and applications
 - Removes application managed message correlation
 - Removes 32K message segment restriction

```
>>---ICAL---aib---request_area---response_area-----><
```

- aib: specifies the application interface block (AIB) that is used for the call.
- request_area: specifies the request area to use for this call.
 - Contains request message data that is sent from the IMS application program to the application that is specified in the OTMA destination descriptor
- response_area: specifies the response area to use for this call.

Synchronous Callout Enhancement

- **IMS 14 introduces an ICAL enhancement to support an optional control data area**

- Well-formed for content and context: LLLL<TAGn> data </TAGn>
 - Any type of control data can be specified and passed to IMS Connect and its external applications
- Consisting of 1 to many control data items
 - Any number of “services” or “operations” can be specified on the same call

- **Benefits**

- Provides a simple method to pass metadata, XML converter override, security credentials, endpoint information, etc., with the callout message
 - Increases the flexibility of callout applications
 - Allows more efficient usage of OTMA destination descriptors with overrides
 - *Fewer descriptors saves ECSA*

Synchronous Callout Enhancement

▪ ICAL – Control data

```
>>---ICAL---aib---request_area---response_area-----><
```

- aib: specifies the application interface block (AIB) that is used for the call.
- request_area: specifies the request area to use for this call.
 - Contains request message data that is sent from the IMS application program to the application that is specified in the OTMA destination descriptor
- response_area: specifies the response area to use for this call.

```
>>---ICAL--aib---request_area---response_area---control_area><
```

- The parameter aib specifies the application interface block (AIB) that is used for the call
 - AIBOPLen - length of the total control area
- The request_area specifies the request area to use for this call.
- The response_area specifies the response area to use for this call.
- The control_area specifies the optional control data to use for this call

The control data can consist of 1 to many control data items:

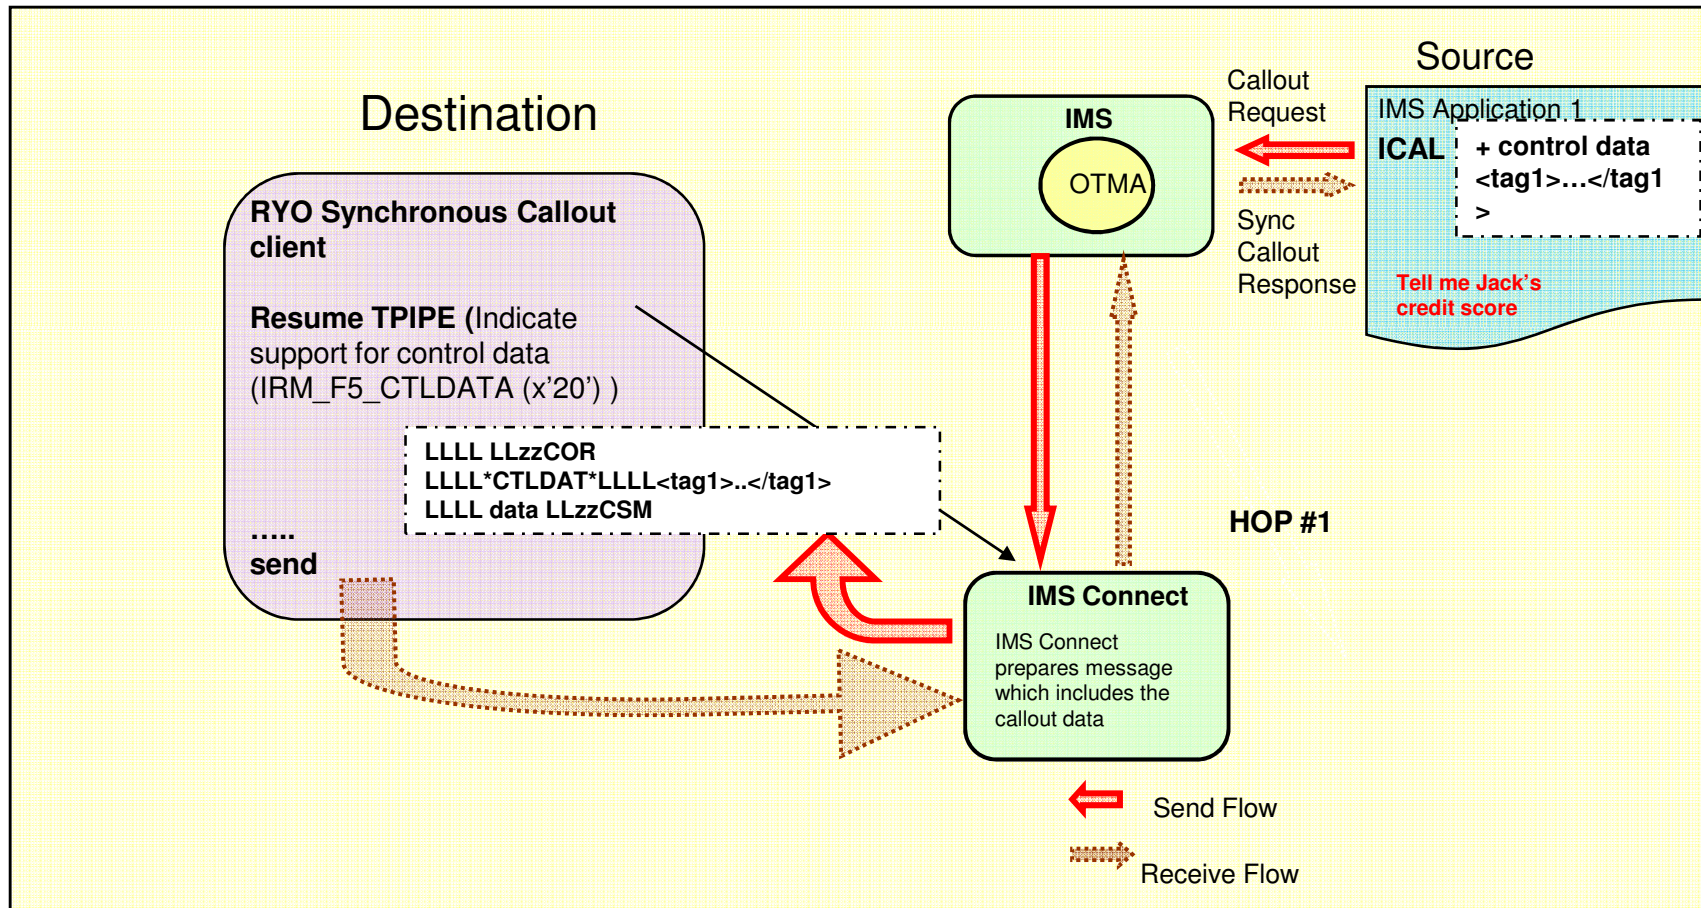

The format of control data item(s) in the ICAL control data are as follows:

```
LLLL | <tag1> | data | </tag1> {LLLL | <tagn> | data | </tagn>...}
```

The tag name and data contents will be treated as binary and passed "as is" to the target client

Synchronous Callout Enhancement ...

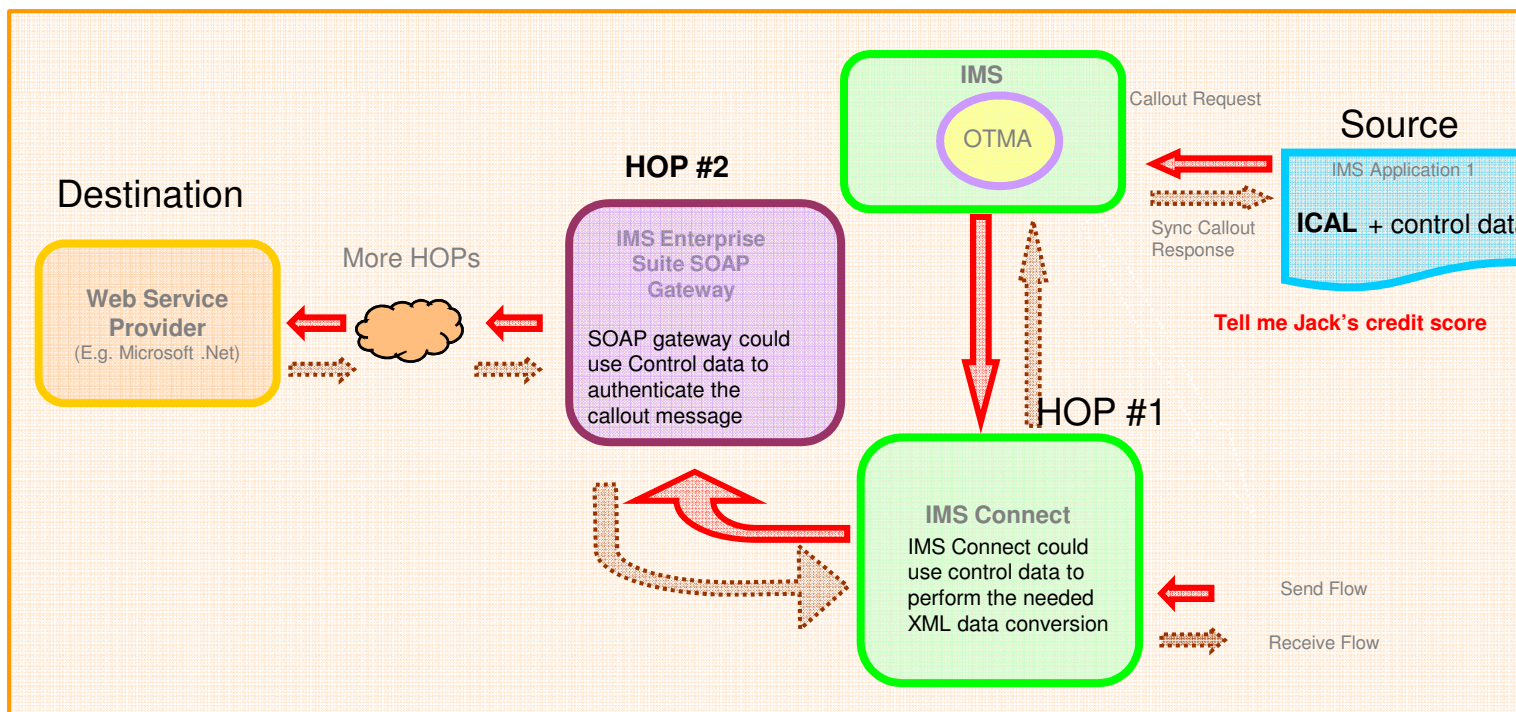

- **EXAMPLE 1: ICAL Control data contains “data about the data”**
 - Provides information to the hops for special processing

Synchronous Callout Enhancement ...

EXAMPLE 2

- Specialized IMS-defined control data items start with **DFS** in the Tag **DFSCNVTR**
 - Identifies that an XML converter name follows in the associated control data field
 - **The converter name and the tags should be in uppercase EBCDIC**
- For IMS Soap Gateway messages
 - Minimizes the number of destination descriptors that have to be specified
 - » Previously, one was needed for each unique converter name

***And support for
a High Availability Environment***

*(workload balancing, sysplex distribution,
failover, etc...)*

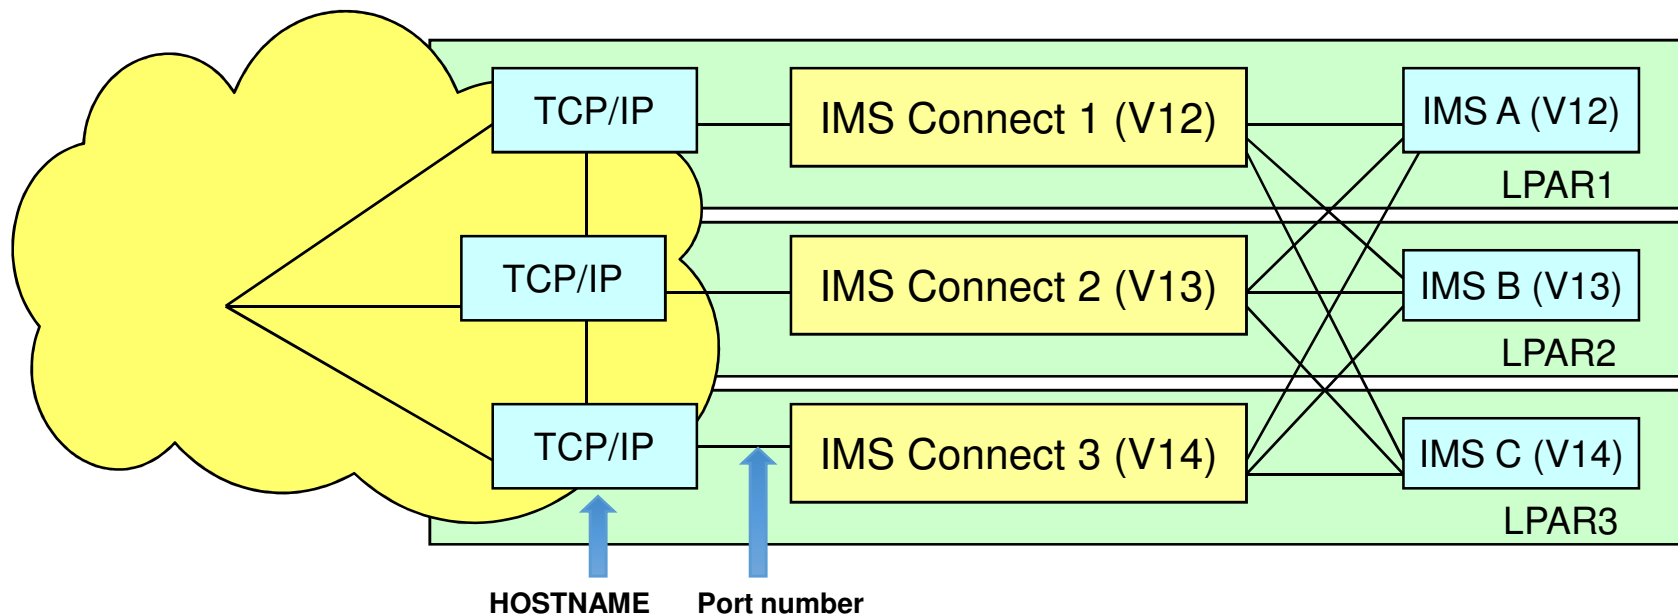

Architecting for Availability

- **The use of mechanisms such as IP spraying, workload balancing and sysplex distribution**

- Allow a connection request to be routed to any of the available IMS Connect instances

- Different versions of IMS Connect and IMS can coexist

- *Mixed versions of IMS Connect and IMS are limited to the functionality of the lower release level*

Port Sharing

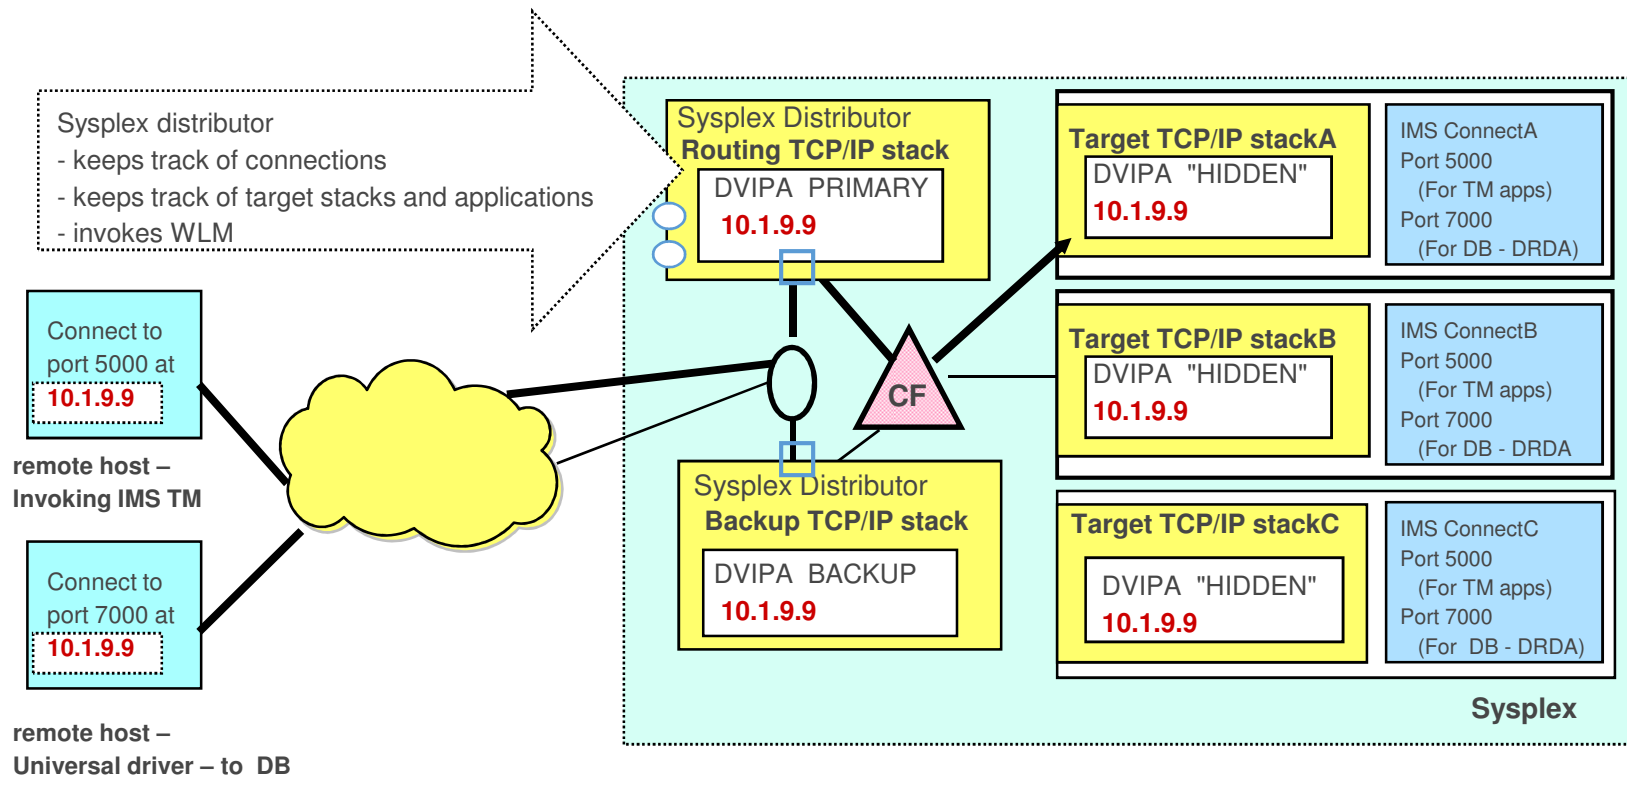

▪ A method to distribute workload for IP applications *within* a z/OS LPAR

- Multiple instances of an application can listen on the same PORT number
 - Allows the workload to be distributed among the server applications listening on the same port
 - Simplifies the request for the remote client that does not know there might be multiple server application instances that can accept the message
- Can be implemented using round-robin distribution or with the workload manager

▪ IMS Connect Ports - Provide the mechanism to access different IMS resources

- Examples:
 - PORTID - defines the PORT numbers for access to IMS TM applications and commands
 - PORT - defines the PORT numbers, distinct from those defined in PORTID
 - *Also for access to IMS TM applications and commands but allow an IMS Connect override of the TCP/IP Keepalive specification*
 - SSLPORT – defines the Secure Socket Layer port (**use AT/TLS instead**)
 - DRDAPORT - used specifically for access to IMS DB.

In a Sysplex Distributor Environment

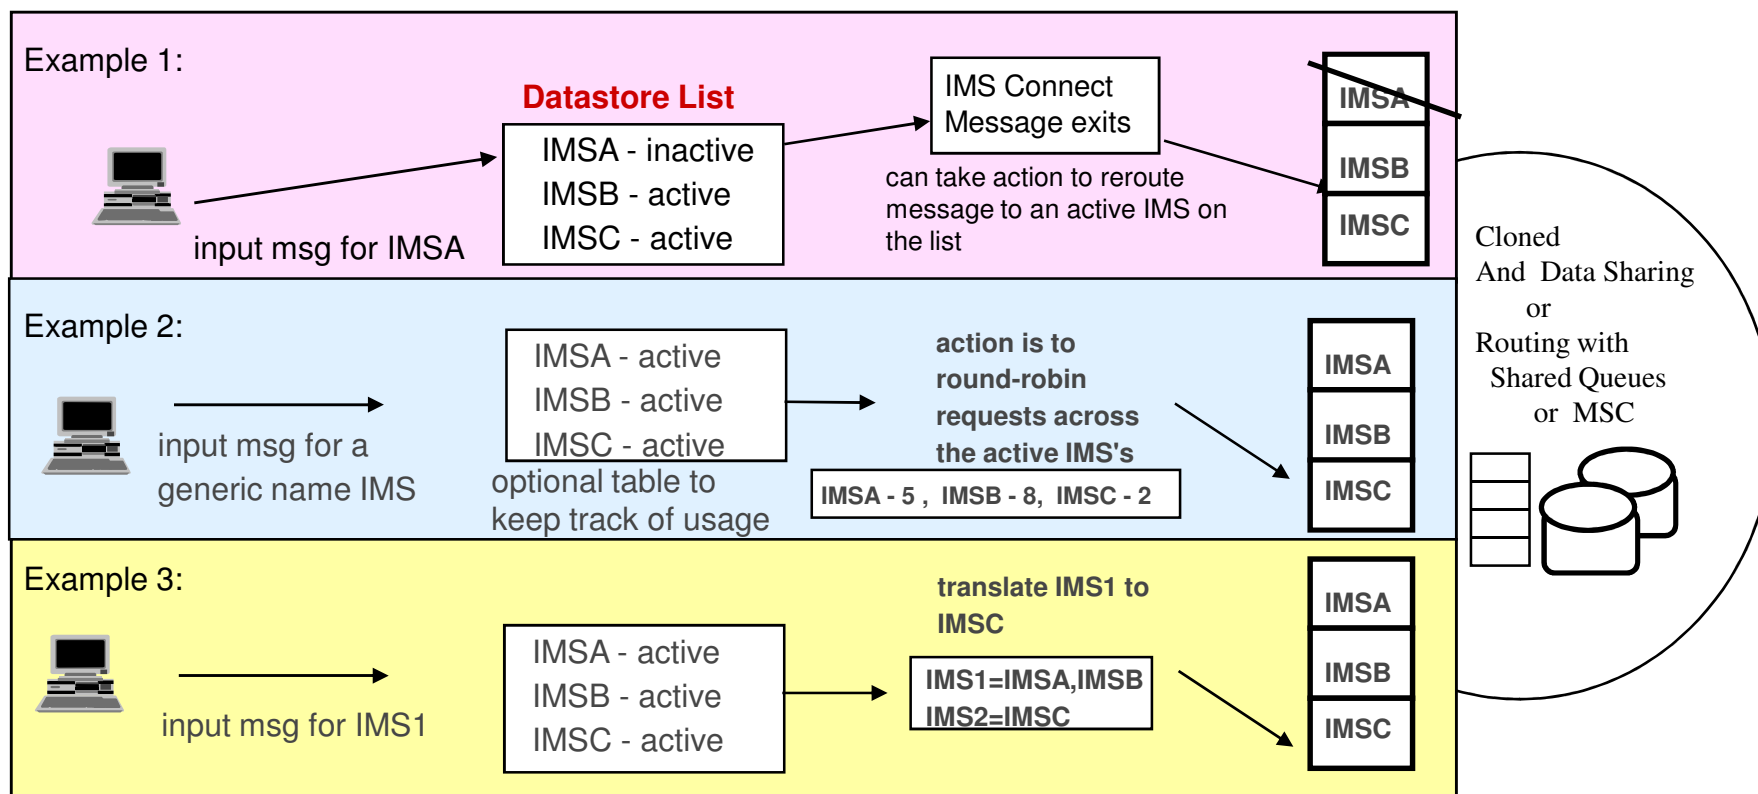

- VIPA (Static Virtual IP Addressing)
 - Eliminates an application's dependence on a particular network interface (IP address)
 - Non-disruptive rerouting of traffic in the event of failure
 - A defined VIPA does not relate to any physical network attachment
 - > There could be multiple network interfaces on a single TCP/IP stack
 - (e.g., 10.1.9.7 and 10.1.9.8 are the physical interfaces in front of virtual 10.1.9.9)

- Dynamic VIPA
 - Support for other TCP/IP stacks to be backup VIPA address
 - Allows an active stack to assume the load of a failing stack
 - > Stacks share information using z/OS XCF messaging

IMS Connect Workload Balancing and Failover

- **Once a message destination is resolved to a particular z/OS host and IMS Connect system**

- IMS Connect can access multiple IMS Systems (datastores)
- Message exits can reroute a message to a different target IMS
 - The Datastore table provides information as to which systems are active

Routing - Transactions

- **Two tables available to IMS Connect Message exits**
 - INIT TABLE
 - Points to the datastore table
 - Allows user data to be stored
 - DATASTORE TABLE (datastore = an IMS system)
 - Contains datastore id's, status (active or inactive) and optional user data
- **User Initialization Exit Routine (HWSUINIT)**
 - USAGE
 - Driven during initialization and termination
 - Load user table(s) and obtain any needed storage
 - Add user data to INIT and DATASTORE tables
 - e.g., define alternate IMS systems
- **IMS Connect provides the interface**
 - IMS Connect message exits that are provided do not take advantage of the capability but can be enhanced to do so
 - Plug-ins such as **IMS Connect Extensions (CEX)** provide routing support

Routing - Databases

- **IMS Connect has an internal table**
 - Keeps track of ODBMS and the IMS datastores and aliases

- **IMS Connect DB Routing Exit routine (HWSROUT0)**
 - Can determine or change the destination of a database access request
 - Select an ODBM by its name
 - Allow IMS Connect to select an ODBM instance
 - *By alias name*
 - » If only one ODBM has specified the alias, the request is routed to that ODBM
 - » If the alias is associated with multiple ODBMs then IMS Connect uses a round-robin technique to route the request across those resources.
 - *If the alias is blanks then IMS Connect round-robins the request across all the ODBM resources in the IMSplex.*
 - Override the alias provided in the incoming request

Note

- **Although the Sysplex Distributor is an efficient mechanism for workload balancing**
 - Balancing only occurs when a new connection is being established
 - If an IMS Connect region fails
 - New connection requests are automatically routed to the remaining active IMS Connect regions and workload balancing occurs among the active regions
 - When the failed IMS Connect is restarted
 - Connections that are already active with other IMS Connect regions are NOT re-balanced
 - *Only NEW connections are routed to the restarted region*
 - Implication:
 - Because many of the connections with IMS Connect are persistent
 - *The environment after an IMS Connect has failed and been restarted, might be unbalanced until enough new connections have been requested.*

And also in support of Sysplex

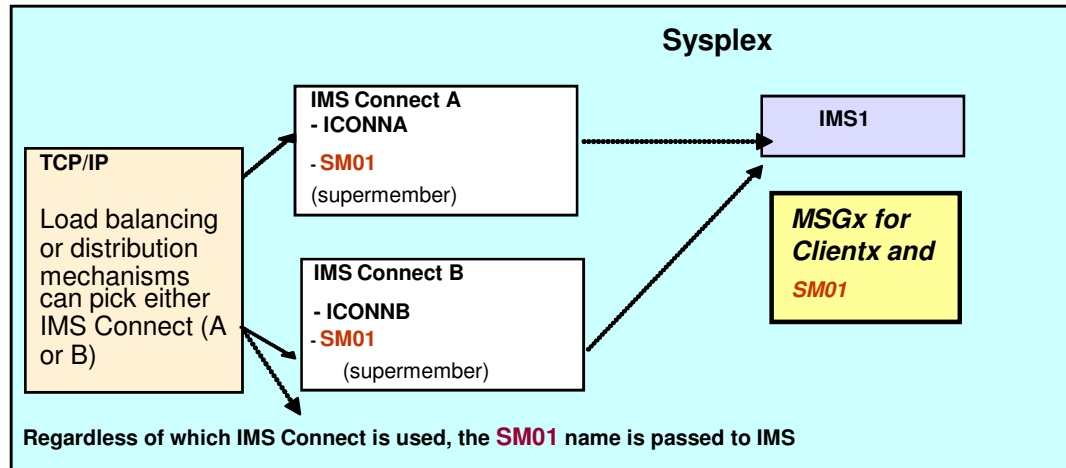

▪ Super member Support (OPTIONAL)

- Allows retrieval (Resume TPIPE requests) of any queued asynchronous messages regardless of the connection path
 - Includes undelivered IOPCB messages along with all unsolicited ALTPCB messages
- A **group name** given to a set of IMS Connect instances
 - *Any IMS Connect can retrieve the message*
- Generic structure name in IMS on which the messages are queued
 - *IMS Connect systems are recognized by IMS by both their specific name and supermember name*
 - *For Shared Queues, no affinity to an IMS system*
 - » Any IMS can deliver the message

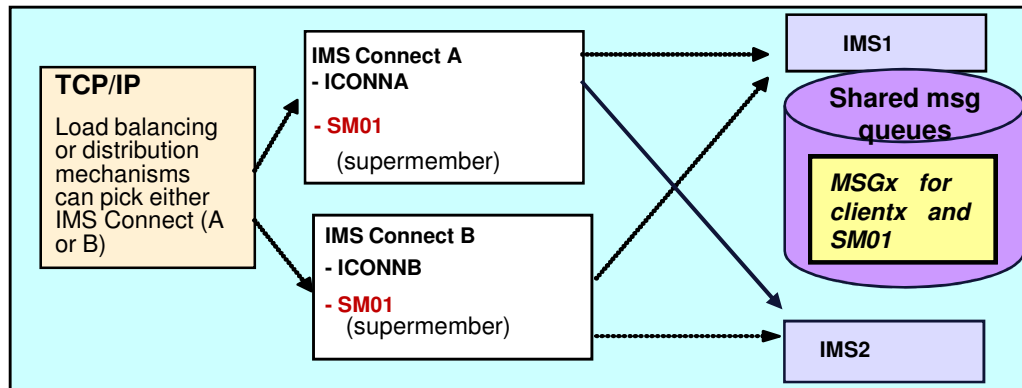

And also in support of Sysplex ...

Resume TPIPE for clientx through IMS Connect for a message in IMS

Clientx

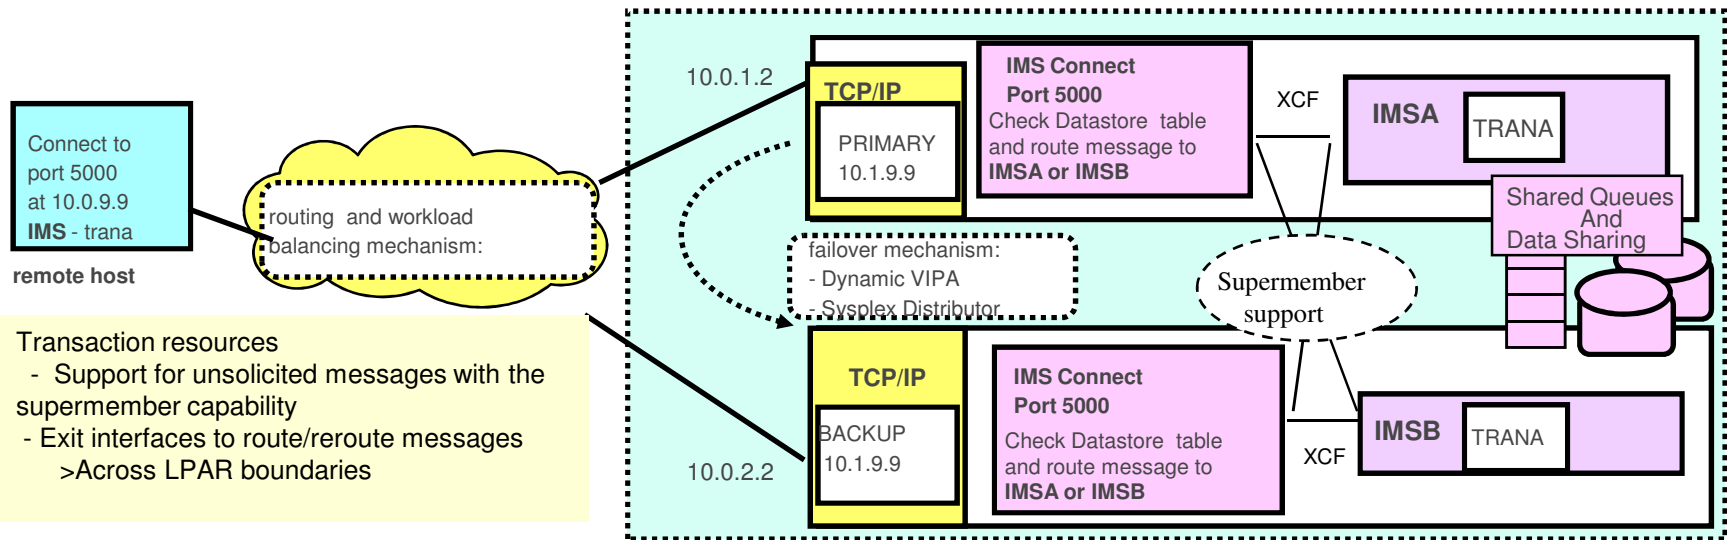

Resume TPIPE for clientx through IMS Connect for a message in IMS

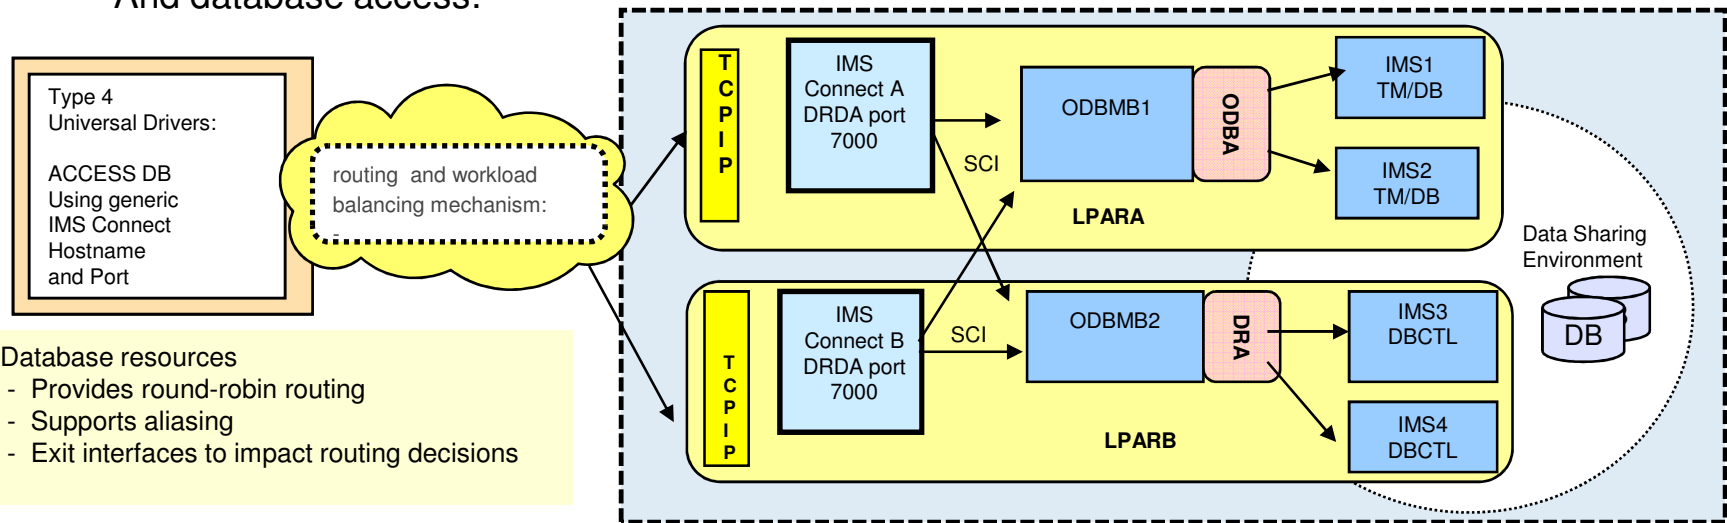

And also in support of Sysplex ...

Transaction access through sysplex distribution and supermember support :

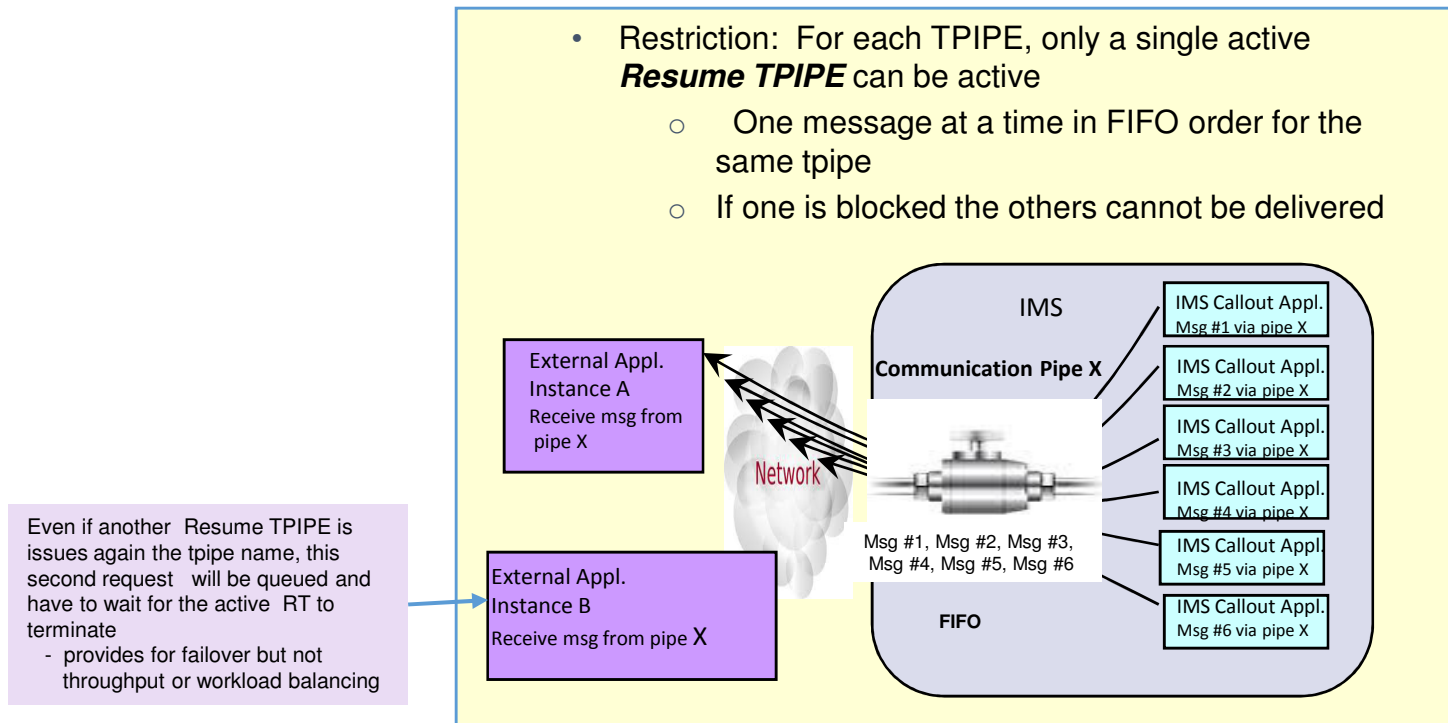

And database access:

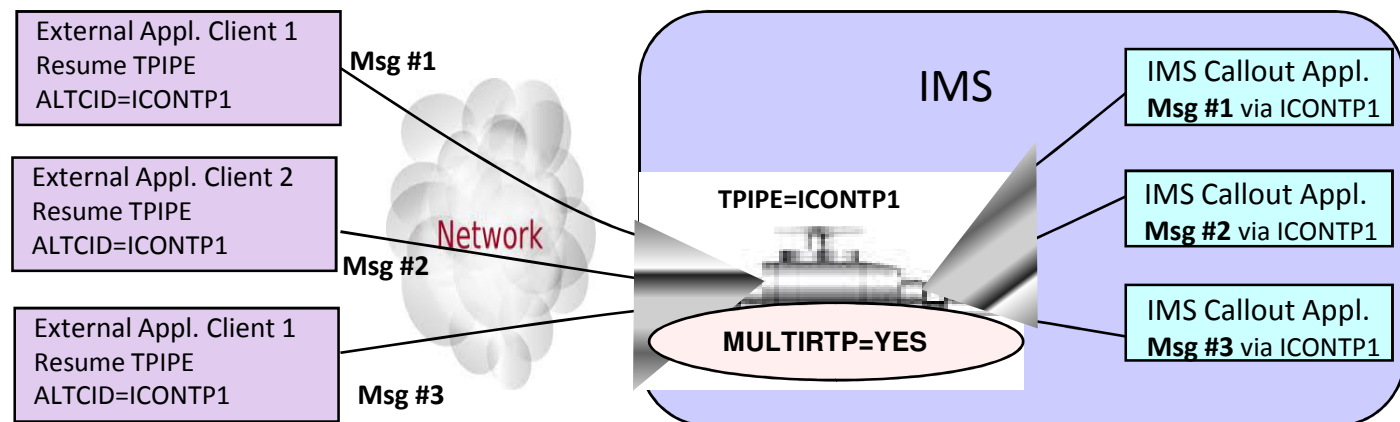

TPIPE Parallelism

- **New in IMS14: ability for multiple Resume TPIPE client requests to be concurrently active on a single TPIPE**
 - Alleviates potential throughput bottlenecks for callout
- **Potential problems in pre-IMS14 systems:**

TPIPE Parallelism ...

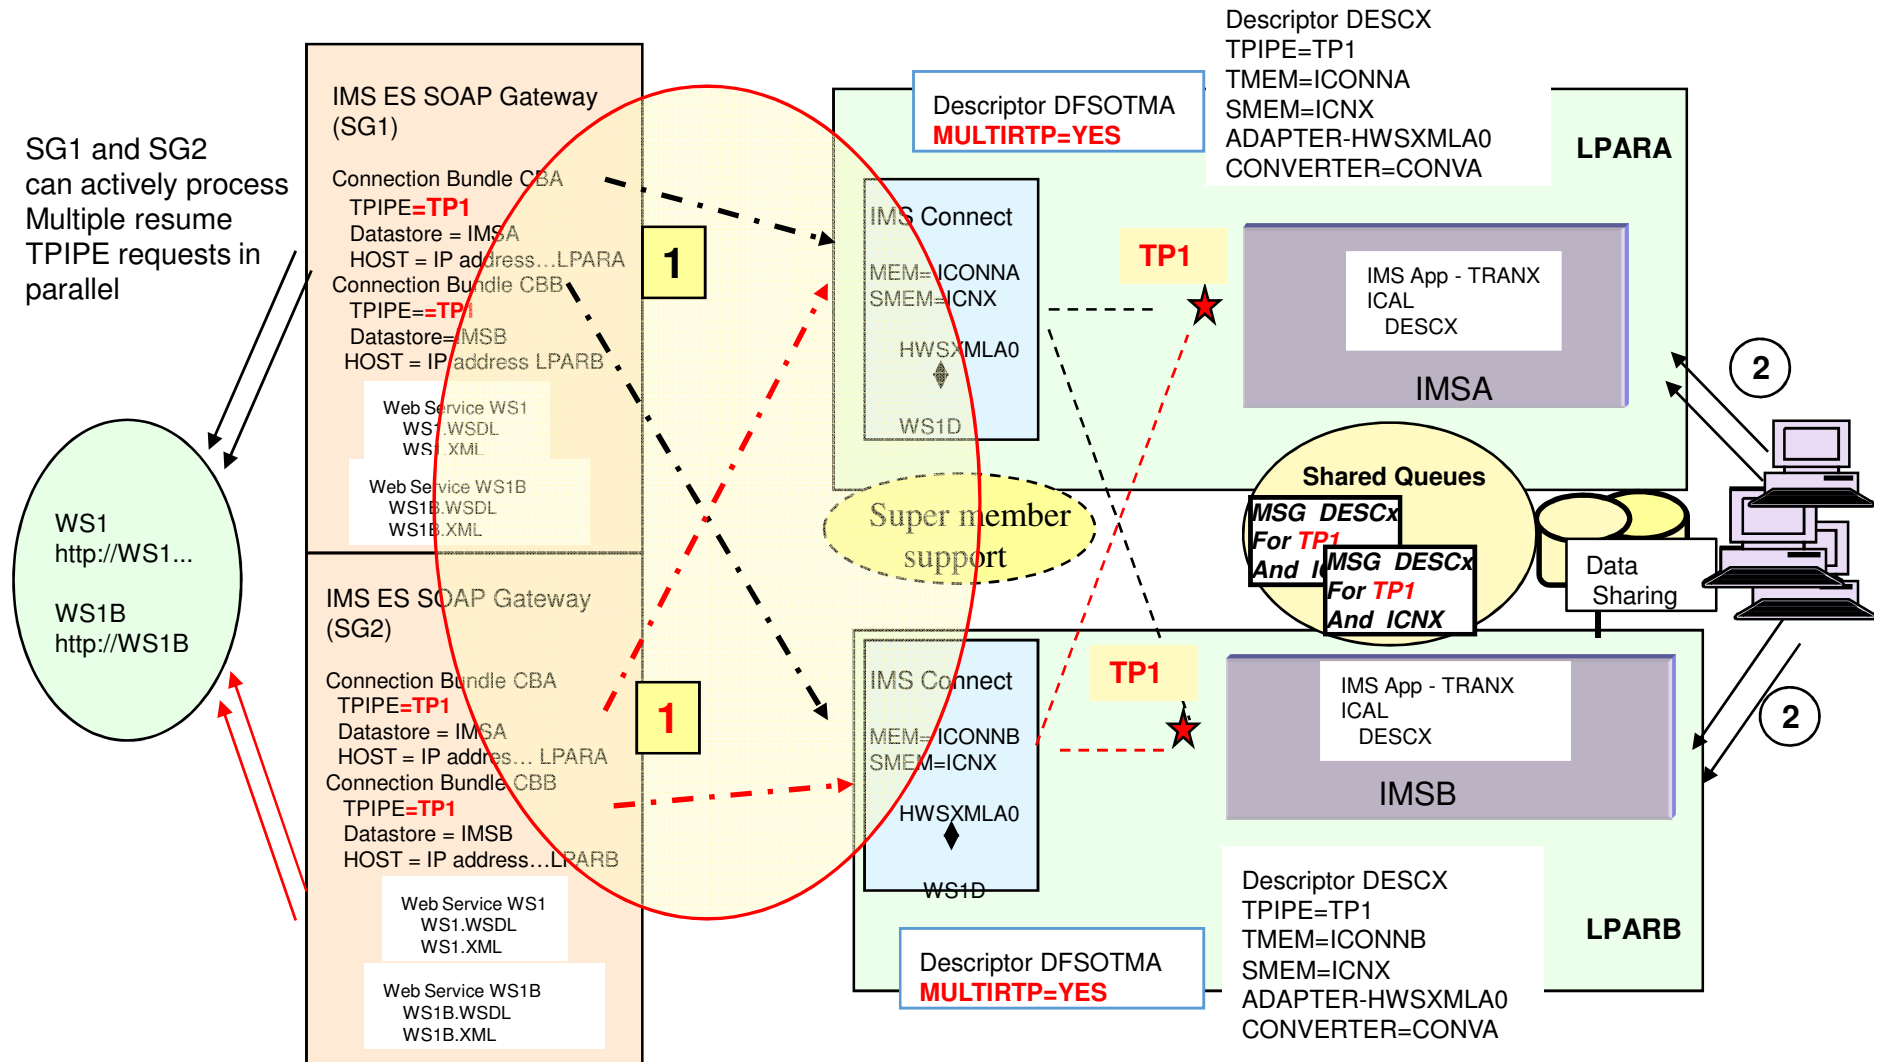

- **MULTIRTP=Y: Enables multiple active Resume TPIPE requests to pull messages from a single TPIPE**
 - Creates additional control blocks up to the LIMITRTP value to support concurrency and to minimize queuing

- Benefit
 - *Supports multiple callout applications to the same TPIPE for best performance and parallelism*
 - » No need to implement circumventions or re-design applications
 - *Resume TPIPE protocol for client requestors remains unchanged*
 - » No new architecture or option required on Resume TPIPE
 - » Still must wait for ACK from each message sent

An Enhanced Environment

- Enhances sysplex environment – parallelism with the same TPIPE name

So... In Review

IMS Connect is more than a TCP/IP Gateway

It is the interface for evolving integration capabilities

And... is the springboard to new connection technologies
